The Pan Acoustics Pan AMT Series is growing!

For a while now, the Pan AMT series has been setting highest standards in terms of natural and transparent audio reproduction in 2-way point-source systems as well as in compact line source speakers. This is achieved by an uncompromised selection of loudspeaker components such as the – Made in Germany – „Air Motion Transformer“ (AMT) from Mundorf. The AMT series is already being deployed successfully in installations and live/theater applications worldwide. The series is now complemented with a new line source.

A combination that can be seen and heard: The slim line source P 12-AMT provides clear, authentic sound, the passive subwoofer P SW-112 rounds off the sound system in the low frequency range.

P 12-AMT is an elegant and powerful line source with balanced frequency and directional characteristics. With a lineup of 12 x 3.5" drivers and Mundorf's AMT tweeter, it easily reaches consistent sound reinforcement distances of up to 20 meters with an overall speaker length of 1.50 meters. The system is passively designed and can be operated without DSP equalization thanks to a complex crossover design. The P 12-AMT is ideally suited for both music and speech applications with highest demands. In combination with the 12" subwoofer P SW-112, the P 12-AMT system becomes a powerful sound reinforcement system - which also meets live sound requirements.

With the addition of P 12-AMT, Pan Acoustics is presenting another exciting sound reinforcement solution for the installation sector, but also for meeting and conference applications.
